THIS APPLICATION IS SUBJECT TO WITHDRAWAL FROM ISSUE AT THE INITIATIVE OF THE OFFICE OR UPON PETITION BY THE APPLICANT. SEE 37 CFR 1.313 AND MPEP 1308.

THE ISSUE FEE AND PUBLICATION FEE (IF REQUIRED) MUST BE PAID WITHIN **THREE MONTHS FROM THE MAILING DATE OF THIS NOTICE** OR THIS APPLICATION SHALL BE REGARDED AS ABANDONED. **THIS STATUTORY PERIOD CANNOT BE EXTENDED.** SEE 35 U.S.C. 151. THE ISSUE FEE DUE INDICATED ABOVE DOES NOT REFLECT A CREDIT FOR ANY PREVIOUSLY PAID ISSUE FEE IN THIS APPLICATION. IF AN ISSUE FEE HAS PREVIOUSLY BEEN PAID IN THIS APPLICATION (AS SHOWN ABOVE), THE RETURN OF PART B OF THIS FORM WILL BE CONSIDERED A REQUEST TO REAPPLY THE PREVIOUSLY PAID ISSUE FEE TOWARD THE ISSUE FEE NOW DUE.

HOW TO REPLY TO THIS NOTICE:

I. Review the SMALL ENTITY status shown above.

If the SMALL ENTITY is shown as YES, verify your current SMALL ENTITY status:

A. If the status is the same, pay the TOTAL FEE(S) DUE shown above.

DETAILED ACTION
EXAMINER'S AMENDMENT

Authorization for this examiner's amendment was given in a telephone interview with Bradley Barinsky in lieu of Robert Crawford on 6/9/2009.

Please amend the Abstract as follows:

A module has test controller for evaluating a functional block. The test controller includes a first register coupled between an input pin and an output pin from a plurality of pins and a second register coupled to the first register for capturing an update of the content of the first register responsive to an update signal from a decoder. The second register is further arranged to generate evaluation control signal. The test controller further includes dedicated control circuitry including a plurality of logic gates and a first logic gate. The plurality of logic gates is arranged to decode the content of the first register and provide the first logic gate with a resulting gating signal for blocking the update of the second register. Consequently, the dedicated control circuitry is able to prevent undesired changes in the module during an evaluation mode of for instance another module.

Please amend claim 7 as following:

7. (Currently amended) A module comprising a functional block and a test controller for controlling the functional block in an evaluation mode of the module, the test controller comprising:

a plurality of pins including an input and an output pin;

a first register coupled between the input pin and the output pin for receiving a bit pattern via the input pin and outputting the bit pattern via the output pin; and

a second register coupled to the first register for capturing the bit pattern responsive to an update signal;

dedicated control circuitry for blocking the update signal responsive to the bit pattern;

a first logic circuit for receiving the update signal and for receiving the bit pattern and coupled to the second register;

a multiplexer having a first input, a second input, an output and a control terminal coupled to an output of the second register;

a first further register coupled between the input pin and the first input of the multiplexer;

a second further register being responsive to the update signal, the second further register having at least an input coupled to the first further register; and a conductor coupled between the input pin and the second input of the multiplexer;

the first register being coupled between the output of the multiplexer and the output pin;
and

the second input of the first logic gate being coupled to the first register via the second register.

Please amend claim 10 as following:

10. (Currently Amended) A module as claimed in claim 7, characterized in that the dedicated control circuitry further comprises a plurality of logic gates being responsive to the bit pattern in the second register, the plurality of logic gates having their inputs coupled to the second further register and having at least an output coupled to the control terminal of the multiplexer.

Allowable Subject Matter

Claims 1-16 are allowed.

Claims 1-16 are allowable over the prior art of record, none of the prior art whether together singularly or in combination to teach the claimed combination as recited. The closest reference No. 6,499,124 does not teach or suggest the improvement of the instant application comprising a dedicated control circuitry for blocking the update signal responsive to a bit pattern and a no-update bypass register configured/coupled with a multiplexer as cited in independent claims 1, 4, 11, and 13; or

a dedicated control circuitry for blocking the update signal responsive to a bit pattern; a first logic circuit for receiving the updated signal for receiving the bit pattern and coupled to the second register; a multiplexer having a first input, a second input, an output and a control terminal coupled to an output of the second register; a first further register coupled between the input pin and the first input of a further multiplexer; a second further register being responsive to the update signal, the second further register having at least an input coupled to the first further register; and a conductor coupled between the input pin and the second input of the further multiplexer; the first register being coupled between the output of the multiplexer and the output pin; and the second input of the first logic gate being coupled to the first register via the second register as cited in independent claim 7.

Instead reference '124 teaches a Boundary-Scan architecture that prevents would-be pirates from replicating the logic of the IC by blocking data that is shifted along the Boundary-Scan chain.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."
